

International Diabetes Center

- The IDC provides world-class diabetes care, education and clinical research to meet the needs of people with diabetes, their families and the health care professionals who care for them
- Our evidence-based, clinically tested publications provide a wide range of resources for your diabetes education needs

Patient Education Materials for Type 2

- Type 2 Diabetes BASICS
- Type 2 Diabetes: The First Step

Noninsulin injectable diabetes medications

Noninsulin injectable diabetes medications keep your glucose level from going too high by:

- ◆ Causing your pancreas to make more insulin.
- ◆ Slowing down how quickly food leaves your stomach.
- ◆ Keeping your liver from making too much glucose.

These medications also make you feel less hungry. Most people who take these medications lose a modest amount of weight.

When you first start taking this medication, you may have nausea. This side effect usually goes away after a few weeks of taking the medication.

The table on the next page shows a typical dosing schedule. Your care team may give you different dosing.
